Scenario no: 3

Requirements – Campus Placement & Internship Pipeline

Problem Statement #03 | Campus & Academic Operations Actors: Student Applicant, Placement Officer

Functional Requirements

ID	Description	Priority	Acceptance Criteria	Rationale
FR-001	The system shall parse uploaded student resumes (PDF format), extract skill tags, and match profiles against active company eligibility rules (CGPA and backlog thresholds).	High	Pass: Ineligible applicants (active backlog, CGPA below cutoff) are filtered out with a clear discrepancy reason shown to the student. Fail: Applicant with active backlog bypasses eligibility filter.	Automated screening removes manual resume triage for hundreds of drives and guarantees consistent, auditable application of eligibility rules.
FR-002	The system shall allow Placement Officers to define, per drive, multi-tier eligibility criteria (minimum CGPA per branch, maximum active backlogs, graduation year) and apply them during screening.	High	Pass: A drive configured with CGPA ≥ 7.5 and 0 backlogs correctly excludes every student who fails either condition. Fail: A student meeting only one of two configured criteria is shortlisted.	Every company sets different eligibility bars; hard-coded rules would break as soon as a new drive is added.
FR-003	The system shall maintain a multi-round	High	Pass: An applicant marked	Placement drives run in sequential

	interview queue per drive (e.g., Aptitude, Technical, HR), allowing Placement Officers to move applicants between rounds and record round-wise outcomes.		"Rejected" in Round 1 is automatically removed from the Round 2 queue. Fail: A rejected applicant still appears in a later round's queue.	elimination rounds; the queue must reflect the current pipeline state at all times to avoid scheduling conflicts.
FR-004	The system shall generate and dispatch digital offer letters to selected applicants and allow the applicant to accept or decline within a configurable deadline.	Medium	Pass: An offer letter generated for a selected student contains the correct CTC, role, and joining-date fields, and the accept/decline action is timestamped and recorded. Fail: An offer letter is generated for an applicant never marked "Selected."	Manual offer-letter drafting is error-prone at scale; a templated, auditable flow prevents mismatched offers and missed deadlines.
FR-005	The system shall send automated notifications (in-app and email) to	Medium	Pass: A student shortlisted for Round 2 receives a notification	Timely communication is critical during placement season;

	student applicants for shortlist status, interview schedule changes, and final results.		within 5 minutes of the status change. Fail: A status change occurs but no notification is generated for the affected student.	students should never have to poll the portal to learn of a status change.

Non-Functional Requirements

ID	Type	Description	Priority	Acceptance Criteria	Rationale
NFR-001	Performance & Security	The system shall encrypt all student academic records and offer documents at rest using AES-256, and enforce TLS 1.2+ for data in transit.	High	Pass: Benchmarking tests confirm target latency and security standards under simulated peak load; a database-level inspection confirms no plaintext PII is stored. Fail: Any academic record or offer document is retrievable in plaintext from storage.	Academic and offer data is highly sensitive PII; a breach would have legal and reputational consequences for the institution and its recruiting partners.
NFR-002	Scalability & Availability	The system shall support at least 2,000 concurrent student sessions and 99.5% uptime during active	High	Pass: Load testing at 2,000 concurrent users shows page response times under 3 seconds with zero dropped	Registration windows and result announcements produce sharp traffic spikes; downtime at these

		placement season (peak drive registration and result windows).	requests. Fail: Response times exceed 3 seconds or requests are dropped at or below 2,000 concurrent users.	moments directly blocks students from time-bound opportunities.

Use-Case Flow Specification

UC-07: Screen Applicants & Apply Eligibility Filters

Primary Actor: Placement Officer **Secondary Actor:** Student Applicant (data owner) **Includes:** UC-06: Parse Resume & Extract Skills **Extended by:** UC-08: Flag Ineligibility Reason (condition: applicant fails at least one eligibility criterion)

Preconditions

- The Placement Officer is authenticated and has Placement Officer role privileges.

- At least one active company drive exists with a defined eligibility rule set (FR-002).
- One or more students have submitted applications with an uploaded resume (FR-001) for the drive.

Postconditions

- **Success:** Every applicant to the drive is tagged as either "Eligible – Shortlisted" or "Ineligible" with a stored discrepancy reason.
- **Success:** Eligible applicants are moved into the Round-1 interview queue (feeds UC-09: Schedule Interview Rounds).
- **Failure:** No applicant status is changed; the drive's applicant list remains in its prior state and an error is logged.

Main Success Scenario

1. The Placement Officer selects an active drive and chooses "Screen Applicants."
2. The system retrieves the full list of applicants for the drive along with their uploaded resumes.
3. The system invokes UC-06 (Parse Resume & Extract Skills) for each applicant, extracting CGPA, backlog count, branch, and skill tags.
4. The system compares each applicant's parsed data against the drive's configured eligibility rules (CGPA threshold, backlog limit, branch/year filters).
5. The system marks applicants who satisfy all criteria as "Eligible – Shortlisted" and enqueues them into the Round-1 interview queue.
6. The system marks applicants who fail one or more criteria as "Ineligible" and triggers UC-08 (Flag Ineligibility Reason) to record and display the specific discrepancy.
7. The system displays a summary screen to the Placement Officer showing counts of shortlisted vs. ineligible applicants.
8. The system dispatches shortlist/status notifications to all affected students (FR-005). Use case ends.

Alternate Flow A1 – Resume Fails to Parse

At step 3, if a resume is corrupted, password-protected, or not in a parseable PDF format:

1. The system flags that applicant's record as "Parsing Failed" instead of computing eligibility automatically.
2. The applicant is excluded from the automatic Eligible/Ineligible decision and placed in a "Manual Review" queue.
3. The system notifies the Placement Officer of the count of applicants requiring manual review.
4. The Placement Officer may manually enter CGPA/backlog values to resume the flow at step 4 for that applicant, or request the student to re-upload a valid resume (re-triggers UC-02: Upload Resume).
5. Use case resumes at step 7 once all manual reviews are resolved.
